## BACKGROUND OF THE INVENTION

## SUMMARY OF THE INVENTION

**Carboxylic acid derivatives of the general formula I**

R<sup>4</sup> is C<sub>1</sub>-C<sub>10</sub>-alkyl which can carry from one to five halogen atoms and/or one of the following radicals: C<sub>1</sub>-C<sub>4</sub>-alkoxy, C<sub>1</sub>-C<sub>4</sub>-alkylthio, cyano, C<sub>1</sub>-C<sub>8</sub>-

phenyl or naphthyl, each of which can be substituted by one or more of the following radicals: halogen, nitro, cyano,

3

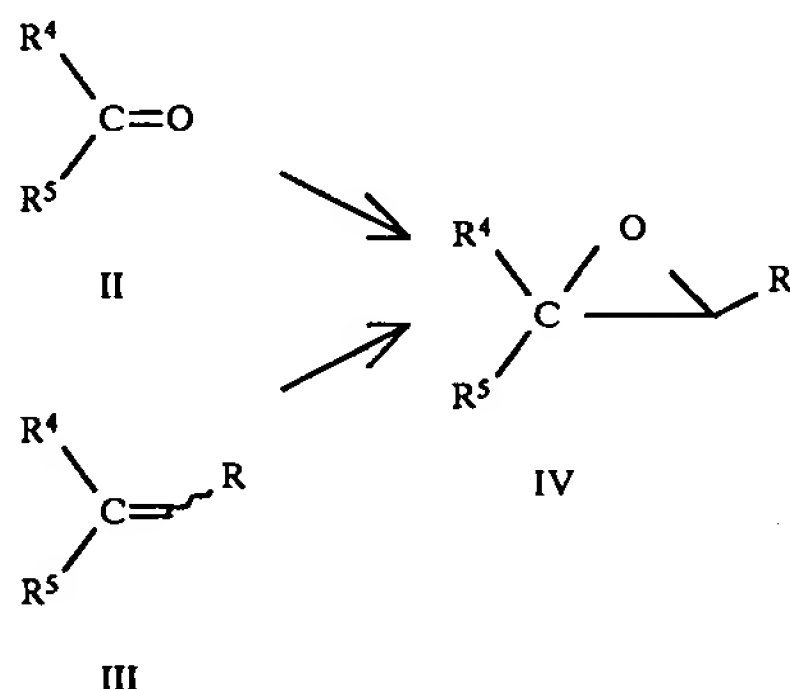

hydroxyl, amino, C<sub>1</sub>-C<sub>4</sub>-alkyl, C<sub>1</sub>-C<sub>4</sub>-haloalkyl, C<sub>1</sub>-C<sub>4</sub>-alkoxy, C<sub>1</sub>-C<sub>4</sub>-haloalkoxy, phenoxy, C<sub>1</sub>-C<sub>4</sub>-alkylthio, C<sub>1</sub>-C<sub>4</sub>-alkylamino or C<sub>1</sub>-C<sub>4</sub>-dialkylamino;

a five- or six-membered heteroaromatic ring which contains from one to three nitrogen atoms and/or one sulfur or oxygen atom and which can carry from one to four halogen atoms and/or one or two of the following radicals: C<sub>1</sub>-C<sub>4</sub>-alkyl, C<sub>1</sub>-C<sub>4</sub>-haloalkyl, C<sub>1</sub>-C<sub>4</sub>-alkoxy, C<sub>1</sub>-C<sub>4</sub>-haloalkoxy, C<sub>1</sub>-C<sub>4</sub>-alkylthio, phenyl, phenoxy or phenylcarbonyl, where the phenyl radicals in turn can carry from one to five halogen atoms and/or from one to three of the following radicals: C<sub>1</sub>-C<sub>4</sub>-alkyl, C<sub>1</sub>-C<sub>4</sub>-haloalkyl, C<sub>1</sub>-C<sub>4</sub>-alkoxy, C<sub>1</sub>-C<sub>4</sub>-haloalkoxy and/or C<sub>1</sub>-C<sub>4</sub>-alkylthio;

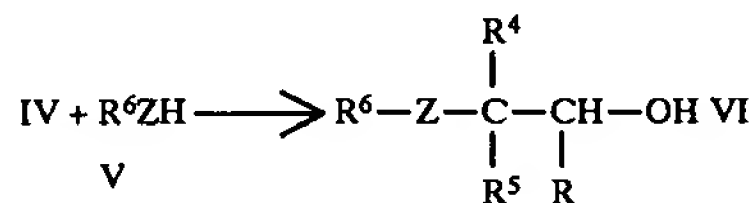

Y is sulfur or oxygen or a single bond;

Z is sulfur or oxygen.

The compounds according to the invention are prepared starting from the epoxides IV which are obtained in a conventional manner, e.g. as described in J. March, *Advanced Organic Chemistry*, 2nd ed., 1983, p. 862 and p. 750, from the aldehydes or ketones II or the olefins III:

Carboxylic acid derivatives of the general formula VI can be prepared by reacting the epoxides of the general formula IV (e.g. with R=COOR<sup>10</sup>) with alcohols or thiols of the general formula V where R<sup>6</sup> and Z have the meanings classified in claim 1.

For this purpose, compounds of the general formula IV are heated with an excess of compounds of the formula V, e.g. 1.2-7, preferably 2-5, mole equivalents, at 50°-200° C., preferably 80°-150° C.

The reaction can also take place in the presence of a diluent. It is possible to use for this purpose all solvents which are inert to the reagents used.

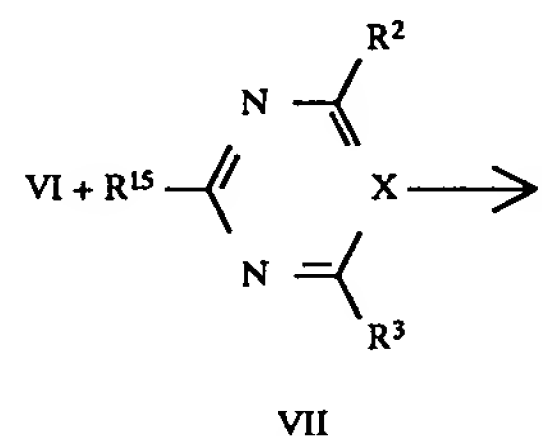

Examples of such solvents or diluents are water, aliphatic, alicyclic and aromatic hydrocarbons, each of which may be chlorinated, such as hexane, cyclohexane, petroleum ether, naphtha, benzene, toluene, xylene, methylene chloride, chloroform, carbon tetrachloride, ethylene chloride and trichloroethylene, ethers such as diisopropyl ether, dibutyl ether, propylene oxide, dioxane and tetrahydrofuran, ketones such as acetone, methyl ethyl ketone, methyl isopropyl ketone and methyl isobutyl ketone, nitriles such as acetonitrile and propionitrile, alcohols such as methanol, ethanol, isopropanol, butanol and ethylene glycol, esters such as ethyl acetate and amyl acetate, acid amides such as dimethylformamide and dimethylacetamide, sulfoxides and sulfones, such as dimethyl sulfoxide and sulfolane, and bases such as pyridine.

4

The reaction is preferably carried out at from 0° C. to the boiling point of the solvent or mixture thereof.

The presence of a catalyst may be advantageous. Suitable catalysts for this purpose are strong organic and inorganic acids as well as Lewis acids. Examples thereof include sulfuric acid, hydrochloric acid, trifluoroacetic acid, boron trifluoride etherate and titanium(IV) alcoholates.

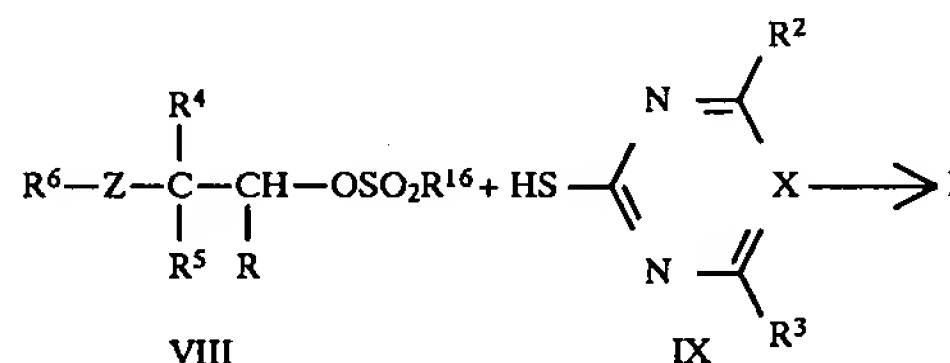

The compounds according to the invention where Y is oxygen and the remaining substituents have the meanings indicated for the general formula I can be prepared, for example, by reacting the carboxylic acid derivatives of the general formula VI in which the substituents have the stated meanings with compounds of the general formula VII

where R<sup>15</sup> is halogen or R<sup>16</sup>-SO<sub>2</sub>, where R<sup>16</sup> can be C<sub>1</sub>-C<sub>4</sub>-alkyl, C<sub>1</sub>-C<sub>4</sub>-haloalkyl or phenyl. The reaction preferably takes place in one of the abovementioned inert diluents with the addition of a suitable base, i.e. a base which deprotonates the intermediate VI, at from room temperature to the boiling point of the solvent.

The base which can be used is an alkali metal or alkaline earth metal hydride such as sodium hydride, potassium hydride or calcium hydride or a carbonate such as an alkali metal carbonate, e.g. sodium or potassium carbonate, an alkali metal or alkaline earth metal hydroxide such as sodium or potassium hydroxide, an organometallic compound such as butyllithium or an alkali metal amide such as lithium diisopropylamide.

The compounds according to the invention where Y is sulfur and the remaining substituents have the meanings indicated for the general formula I can be prepared, for example, by reacting carboxylic acid derivatives of the general formula VIII, which can be obtained in a conventional manner from compounds of the general formula VI and in which the substituents have the above-mentioned meanings, with compounds of the general formula IX where R<sup>2</sup>, R<sup>3</sup> and X have the meanings indicated for the general formula I.

The reaction preferably takes place in one of the abovementioned inert diluents with the addition of a suitable base, i.e. a base which deprotonates the intermediate IX, at from room temperature to the boiling point of the solvent.

Besides the abovementioned bases it is also possible to use organic bases such as tertiary amines, e.g. triethylamine, pyridine, imidazole or diazabicycloandecene.

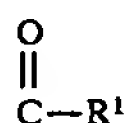

Compounds of the formula I can also be prepared by starting from the corresponding carboxylic acids, i.e. compounds of the formula I where R<sup>1</sup> is hydroxyl, and initially converting these in a conventional way into an activated

5

form, such as a halide, an anhydride or imidazolidine, and then reacting the latter with an appropriate hydroxyl compound HOR<sup>10</sup>. This reaction can be carried out in the conventional solvents and often requires addition of a base, in which case those mentioned above are suitable. These two steps can also be simplified, for example, by allowing the carboxylic acid to act on the hydroxyl compound in the presence of a dehydrating agent such as a carbodiimide.

Compounds of the formula I can also be prepared by starting from salts of the appropriate carboxylic acids, i.e. from compounds of the formula I where R is COR<sup>1</sup> and R<sup>1</sup> is OM where M can be an alkali metal cation or the equivalent of an alkaline earth metal cation. These salts can be reacted with many compounds of the formula R<sup>1</sup>-A where A is a conventional nucleofugic leaving group, for example halogen such as chlorine, bromine, iodine or aryl- or alkyl-sulfonyl which is unsubstituted or substituted by halogen, alkyl or haloalkyl, such as toluenesulfonyl and methylsulfonyl, or another equivalent leaving group. Compounds of the formula R-A with a reactive substituent A are known or can easily be obtained using general expert knowledge. This reaction can be carried out in the conventional solvents, advantageously with the addition of a base, those mentioned above being suitable.

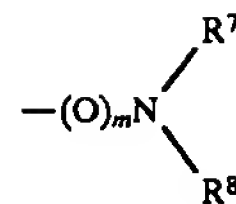

The radical R in formula I can vary widely. R is, for example,

The compounds of the present invention provide a novel therapeutic potential for the treatment of hypertension, pulmonary hypertension, myocardial infarct, angina pectoris, acute kidney failure, renal insufficiency, cerebral vasospasms, cerebral ischemia, subarachnoid hemorrhage, migraine, asthma, atherosclerosis, endotoxic shock, endotoxin-induced organ failure, intravascular coagulation, restenosis after angioplasty and cyclosporin-induced kidney failure or hypertension.

The good effect of the compounds can be shown in the following experiments:

#### Receptor-binding studies

Cloned human ETA receptor-expressing CHO cells and guinea pig cerebellar membranes with >60% ETB receptors compared with ETA receptors were used for binding studies.

#### Membrane preparation

The ETA receptor-expressing CHO cells were grown in F<sub>12</sub> medium with 10% fetal calf serum, 1% glutamine, 100 U/ml penicillin and 0.2% streptomycin (Gibco BRL, Gaithersburg, Md., USA). After 48 h, the cells were washed with PBS and incubated with 0.05% trypsin-containing PBS for 5 min. The mixture was then neutralized with F<sub>12</sub> medium and the cells were collected by centrifugation at 300 ×g. For lysis of the cells, the pellet was briefly washed with lysis buffer (5 mM tris-HCl, pH 7.4 with 10% glycerol) and then incubated at a concentration of 10<sup>7</sup> cells/ml of lysis buffer at 4° C. for 30 min. The membranes were centrifuged at 20,000×g for 10 min, and the pellet was stored in liquid nitrogen.

Guinea pig cerebella were homogenized in a Potter-Elvehjem homogenizer and obtained by differential centrifugation at 1000×g for 10 min and repeated centrifugation of the supernatant at 20,000×g for 10 min.

#### Binding assays

For the ETA and ETB receptor binding assay, the membranes were suspended in incubation buffer (50 mM tris-

HCl, pH 7.4 with 5 mM MnCl<sub>2</sub>, 40 μg/ml bacitracin and 0.2% BSA) at a concentration of 50 μg of protein per assay mixture and incubated at 25° C. with 25 pM [125I]-ET<sub>1</sub> [sic] (ET<sub>A</sub> receptor assay) or 25 pM [125I]-RZ<sub>3</sub> [sic] (ETB receptor assay) in the presence and absence of test substance. The non-specific binding was determined using 10<sup>-7</sup> M ET<sub>1</sub>. After 30 min, the free and the bound radioligand were separated by filtration through a GF/B glass fiber filter (Whatman, England) in a Skatron cell collector (Skatron, Lier, Norway), and the filters were washed with ice-cold tris-HCl buffer, pH 7.4 with 0.2% BSA. The radioactivity collected on the filters was quantified using a Packard 2200 CA liquid scintillation counter.

The K<sub>i</sub> values were determined by non-linear regression analysis using the LIGAND program.

Table A shows the effect of compounds of the formula I as the K<sub>i</sub> [mol/l] determined in the experiments.

Functional in vitro assay system for searching for endothelin receptor (subtype A) antagonists

This assay system is a functional cell-based assay for endothelin receptors. Certain cells when stimulated with endothelin 1 (ET1) show an increase in the intracellular calcium concentration. This increase can be measured in intact cells which have been loaded with calcium-sensitive dyes.

1-Fibroblasts which have been isolated from rats and in which an 35 endogenous endothelin receptor of subtype A

has been detected were loaded with the fluorescent dye Fura 2-an as follows: after trypsinization the cells were resuspended in buffer A (120 mM NaCl, 5 mM KCl, 1.5 mM MgCl<sub>2</sub>, 1 mM CaCl<sub>2</sub>, 25 mM HEPES, 10 mM glucose, pH 7.4) to a density of  $2 \times 10^6$ /ml and incubated with Fura 2-am (2  $\mu$ M), Pluronic F-127 (0.04%) and DMSO (0.2%) at 37° C. in the dark for 30 min. The cells were then washed twice with buffer A and resuspended at  $2 \times 10^6$ /ml.

The fluorescence signal at Ex/Em 380/510 from  $2 \times 10^5$  cells per mL was recorded continuously at 30° C. The test substances were added to the cells and, after incubation with ET1 for 3 min, the maximum change in the fluorescence was determined. The response of the cells to ET1 without previous addition of a test substance served as control and was set equal to 100%.

Table B indicates the effect of the compounds of the formula I as the IC<sub>50</sub> [mol/l] determined in the experiments.

#### Testing of ET antagonists in vivo

Male SD rats weighing 250–300 g were anesthetized with amobarbital, artificially ventilated, vagotomized and pithed. The carotid artery and jugular vein were catheterized.

In control animals, intravenous administration of 1  $\mu$ g/kg ET1 leads to a distinct rise in blood pressure which persists for a lengthy period.

5 min before administration of ET1, the test animals received the test compounds by i.v. injection (1 ml/kg). To determine the ET-antagonistic properties, the rise in blood pressure for the test animals was compared with that for the controls.

#### Endothelin-1-induced sudden death in mice

The test is based on the inhibition of the sudden heart death of mice which is caused by endothelin, probably by constriction of the coronary vessels, on pretreatment with endothelin receptor antagonists. Intravenous injection of 10 nmol/kg endothelin in a volume of 5 ml/kg of body weight is followed within a few minutes, by the death of the animals.

The lethal endothelin-1 dose is checked in each case on a small group of animals. Intravenous administration of the test substance is followed, usually after 5 min, by the lethal endothelin-1 injection in the reference group. With other modes of administration the times between the doses are longer, where appropriate up to several hours.

The survival rate is recorded and effective doses for protection of 50% of the animals (ED 50) against endothelin-induced heart death for 24 h or longer are determined.

#### Functional vessel test for endothelin receptor antagonists

Initially, a contraction is induced by K<sup>+</sup> in segments of rabbit aorta after an initial tension of 2 g and a relaxation time of 1 h in Krebs-Henseleit solution at 37° C. and pH 7.3–7.4. After washing out, an endothelin dose-response plot is constructed up to a maximum.

Potential endothelin antagonists are administered to other specimens of the same vessel 15 min before starting the endothelin dose-response plot. The effects of the endothelin are calculated as a % of the K<sup>+</sup>-induced contraction. Effective endothelin antagonists cause a shift to the right in the endothelin dose-response plot.

The compounds according to the invention can be administered orally or parenterally (subcutaneously, intravenously, intramuscularly, intraperitoneally) in a conventional way. Administration can also take place with vapors or sprays through the nasal pharyngeal space.

The dosage depends on the age, condition and weight of the patient and on the mode of administration. As a rule, the daily dose of active substance is about 0.5–50 mg/kg of body weight on oral administration and about 0.1–10 mg/kg of body weight on parenteral administration.

The novel compounds can be administered in conventional solid or liquid pharmaceutical forms, eg. uncoated or (film-)coated tablets, capsules, powders, granules, suppositories, solutions, ointments, creams or sprays. These are produced in a conventional way. For this purpose the active substances can be processed with conventional pharmaceutical aids such as tablet binders, fillers, preservatives, tablet disintegrants, flow regulators, plasticizers, wetting agents, dispersants, emulsifiers, solvents, release-slowing agents, antioxidants and/or propellant gases (cf. H. Sucker et al.: Pharmazeutische Technologie, Thieme-Verlag, Stuttgart, 1991). The forms obtained in this way normally contain from 40 0.1 to 90% by weight of active substance.

19.5 g (88 mmol) of methyl 3-(3-methoxyphenyl)-2,3-epoxybutyrate are dissolved in 200 ml of absolute methanol, and 0.1 ml of boron trifluoride etherate is added. The mixture is stirred at room temperature for 12 hours and the solvent is removed by distillation. The residue is taken up in ethyl acetate, washed with sodium bicarbonate solution and water and dried over sodium sulfate. After removal of the solvent by distillation, 21.1 g of a pale yellow oil remain.

Yield: 94% (1:1 mixture of diastereomers)

##### EXAMPLE 2

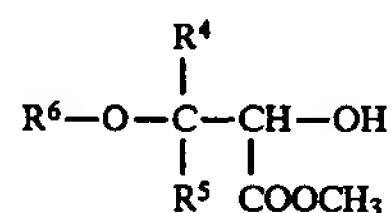

#### Methyl 3-benzyloxy-3-phenyl-2-hydroxybutyrate

9.6 g (50 mmol) of methyl 3-phenyl-2,3-epoxybutyrate are dissolved in 150 ml of benzyl alcohol, and 0.5 ml of concentrated sulfuric acid is added. The mixture is stirred at 50° C. for 6 hours and allowed to cool to room temperature. After neutralization with sodium bicarbonate solution, the excess benzyl alcohol is removed by distillation under high vacuum, and the residue is purified by flash chromatography on silica gel with 9:1 n-hexane/ethyl acetate. After removal of the solvent by distillation, 6.5 g of a colorless oil remain.

Yield: 43% (3:2 mixture of diastereomers)

All the compounds mentioned in Table 1 were prepared in a similar way.

## Methyl 3-phenoxy-3-phenyl-2-[(4,6-dimethoxy-2-pyrimidinyl) thio]butyrate [sic]

7.2 g (25 mmol) of methyl 3-phenoxy-3-phenyl-2-hydroxybutyrate (comp. 1.1) are dissolved in 50 ml of dichloromethane, 3 g (30 mmol) of triethylamine are added and, while stirring, 3.2 g (28 mmol) of methanesulfonyl chloride are added dropwise. The mixture is stirred at room temperature for 2 hours, washed with water, dried over magnesium sulfate and concentrated under reduced pressure. The residue is taken up in 100 ml of DMF and added dropwise to a suspension of 12.9 g (75 mmol) of 4,6-dimethoxypyrimidine-2-thiol and 8.4 g (100 mmol) of sodium bicarbonate in 100 ml of DMF at 0° C. After stirring at room temperature for 2 hours and at 60° C. for a further 2 hours, the mixture is poured into 1 l of ice-water, and the precipitate is filtered off with suction. Drying results in 4.2 g of a white powder.

Yield: 38%

The compounds specified in Table 4 were prepared in a similar way to the above examples.
